DotStark AI Booking Agent

Client overview

What it is

DotStark AI Booking Agent lets your customers book appointments by chatting. A customer opens a chat window on your website, or messages you on WhatsApp, and an AI assistant guides them to a confirmed booking. No forms to fill. No phone tag. You manage everything from one dashboard: your hours, the questions the assistant asks, and every conversation and booking.

Who it's for

Any team that runs appointments: clinics and practices, salons and spas, law and accounting firms, tutors and coaches, agencies, and service businesses. If your team spends time answering "do you have availability?" questions, this product handles that work around the clock.

How it works

For your customers

A customer opens the chat and types what they want, for example "I need a consultation next Tuesday afternoon." The assistant asks for the details you need, shows real available times in the customer's timezone, and confirms the booking. If you require it, the customer verifies their email with a one-time code before the booking is confirmed. The customer receives a confirmation email. They can reschedule or cancel later in the same chat.

For your team

You set up the assistant once: your business name, the fields you want collected, weekly hours, slot length, and how far ahead customers can book. A calendar shows every booking. An inbox lists every conversation with its channel and status. When a customer needs a human, you take over the conversation from the inbox, chat live, and hand it back to the AI when done. If a customer asks about your services, the assistant answers from documents you upload or your website content.

Capabilities

Capability	What it means
Conversational booking	Customers book by typing. The assistant collects and checks the details you define, from names to service-specific fields.
Live availability	Real-time slots based on your schedule, breaks, and exception days, shown in the customer's timezone.
No double-bookings	A slot is reserved while the customer confirms, and the booking is committed safely. Two customers can never take the same time.
Email verification	An optional one-time code confirms the customer's email before booking, filtering mistyped or fake contacts.
Automatic confirmations	Confirmation emails go to the customer and to your team.

Calendar and meeting links	Bookings appear in Google Calendar or Outlook. For online-only businesses, meeting links are created automatically from Google Meet, Microsoft Teams, or Zoom.
Human handoff	Your team takes over a conversation from the inbox, replies live, and releases it back to the AI.
Knowledge answers	The assistant answers questions about your business from PDFs you upload and your website pages.
Self-service changes	Customers reschedule or cancel in chat, without calling you.
WhatsApp channel	The same assistant answers on WhatsApp Business.
One dashboard	Setup, bookings, conversations, and integrations in a single place.
Data isolation	Each business keeps its own settings, documents, and data.

Use cases

- A **clinic** books consultations around the clock, with verified patient emails.
- A **law firm** captures qualified leads before the first call and routes complex cases to a human.
- An **agency** runs online discovery calls with meeting links created automatically.
- A **service business** takes after-hours bookings and lets customers move appointments themselves.

Editions

Edition	Description
Standard	The booking agent on your website. Self-serve setup, embed in minutes, all core features.
Professional	For teams running several sites or brands. Multi-site embeds, expanded branding options, and priority support.
Custom	For larger organizations. Tailored deployment, custom integrations, and managed hosting.

Glossary

- **Chat widget** — the small chat window embedded on your website.
- **OTP** — one-time password: a short code sent by email to confirm the customer's address.
- **Slot** — one bookable time period, for example 30 minutes.
- **Booking window** — how far ahead customers can book.
- **Meeting link** — a video call link from Google Meet, Microsoft Teams, or Zoom.
- **Knowledge answers** — the assistant reads your documents (PDFs and website pages) to answer questions, and shows the page it drew from.
- **WebSocket** — a connection that delivers new messages instantly instead of checking repeatedly.
- **Multi-tenant** — one system serves many businesses, with each business's data kept separate.
